

Automated detection of tunnel excavation (Technion)

code: CIV-1108

Cross-borders smuggling tunnels pose a very serious threat to security. Recent advances in strain measurement by fiber-based Brillouin optical time domain reflectometry (BODTR), led to the development of commercially available systems with sensitivity of less than 5 μ m and spatial resolution of 1m, thus enabling sufficiently sensitive device, which can detect tunnel excavation through the strains the tunnel causes near the surface.
