

### Texture mapping of 3D models using casual images (Technion)

**code:** COM-1117

Texture mapping from 2D images is a method for adding detail, surface texture or color to a computer-generated graphic or three-dimensional model, commonly used in computer graphics, computer games, virtual worlds, etc. In the known solutions to the problem, when a casual image is used, high distortions in the texturing occur. Our technology avoids such distortions by formulating the mapping as a camera projection matrix.
